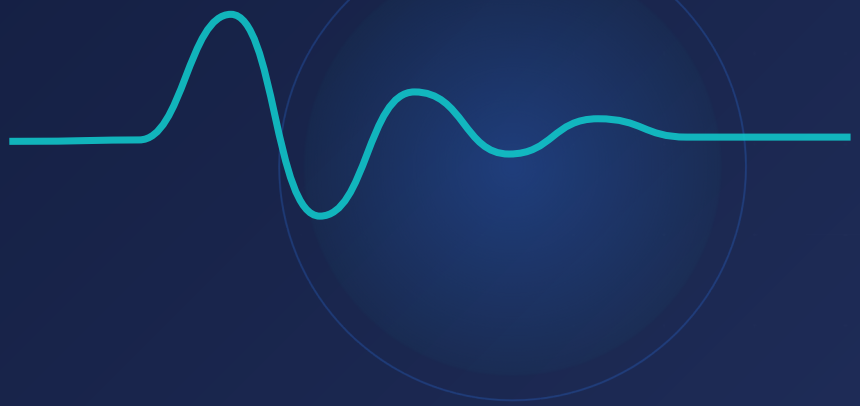
ENGINEERING • DATA • INTELLIGENCE

From physical processes to actionable intelligence.

Blue Waymark takes its name from celestial navigation. A guiding star in an indigo sky gives you a point of reference. We build engineering and software tools that help industrial teams find that same clarity in complex operations, connecting equipment, processes, and data so people can see what's happening and decide what to do next.

Project delivery • Multidisciplinary engineering • Scalable execution



From operational need to delivered digital capability

Our experience spans the complete delivery chain: capturing reliable data, connecting existing and custom systems, building scalable platforms, applying the right analytical method, and placing usable outputs in the hands of operators and managers.

Delivered end-to-end

We work beyond analysis—from field interfaces and engineering to applications and deployment.

Experienced across disciplines

Mechanical, electronics, control, software, data, analytics, and domain specialists.

Built for real use

Solutions are designed around operating conditions, existing systems, users, and maintainability.

01

Capture

Engineer reliable acquisition from physical and digital sources.

02

Connect

Implement integration across IT, OT, and custom systems.

03

Manage

Build governed platforms that store and serve data at scale.

04

Analyze

Develop and validate methods suited to the real problem.

05

Deliver

Put outputs into workflows, applications, and operations.

Experience connecting physical assets and digital systems

Operational Technology
PLCs, controllers, industrial equipment, sensors, actuators

Information Technology
Enterprise applications, databases, APIs, files, legacy systems

Custom Instrumentation
Purpose-built electronics, acquisition units, gateways, edge devices

Physical Systems
Mechanisms, fixtures, enclosures, test rigs, specialized assemblies

UNIFIED ENGINEERING & DATA LAYER

Delivery experience across heterogeneous and legacy environments

- Protocol adaptation & gateways
- APIs & system integration
- Edge processing & buffering
- Streaming & event pipelines
- Data models & governance
- Monitoring & observability
- Identity & access patterns
- Deployment & lifecycle support

Operational Visibility
Dashboards, alarms, traceability, condition awareness

Decision Support
Insights, recommendations, forecasting, prioritization

Workflow Integration
Usable outputs within existing business and operational processes

Automation Readiness
Reliable data and interfaces prepared for controlled automation

The engineering capacity to take projects from concept to operation

PHYSICAL LAYER

Mechanical Engineering

System concepts, mechanisms, fixtures, housings, test setups, prototyping, and manufacturability support.

ELECTRONIC LAYER

Electronics & Instrumentation

Sensor interfaces, acquisition hardware, embedded units, signal conditioning, gateways, and custom devices.

CONTROL LAYER

Automation & OT

PLC and controller connectivity, industrial communications, equipment interfacing, edge logic, and operational integration.

APPLICATION LAYER

Software Engineering

Web and mobile applications, APIs, enterprise integration, user workflows, dashboards, and maintainable product platforms.

DATA LAYER

Data Engineering

Big-data architectures, ingestion pipelines, storage, processing, data quality, governance, and scalable data products.

INTELLIGENCE LAYER

Analytics & Applied Intelligence

Mathematical modeling, statistics, probability, signal and image processing, computer vision, machine learning, and AI.

Domain experts | Solution architects | Product design | Quality engineering | Deployment support | Scalable team formation

Platforms and applications built for day-to-day use

1 **Ingestion & Connectivity**
Batch, streaming, APIs, industrial protocols, files, devices, and databases

2 **Storage & Processing**
Structured and unstructured data, scalable compute, transformation, and orchestration

3 **Quality & Governance**
Validation, lineage, access, monitoring, metadata, and trustworthy definitions

4 **Services & Integration**
Reusable APIs, event services, business rules, interoperability, and secure access patterns

5 **User Experience**
Operational dashboards, portals, mobile tools, alerts, workflows, and reports

Applied intelligence engineered for real operations

Our work does not end with a model or a proof of concept. We turn the selected method into a tested component that connects to real data, applications, workflows, and operational decisions.

Method matched to the job

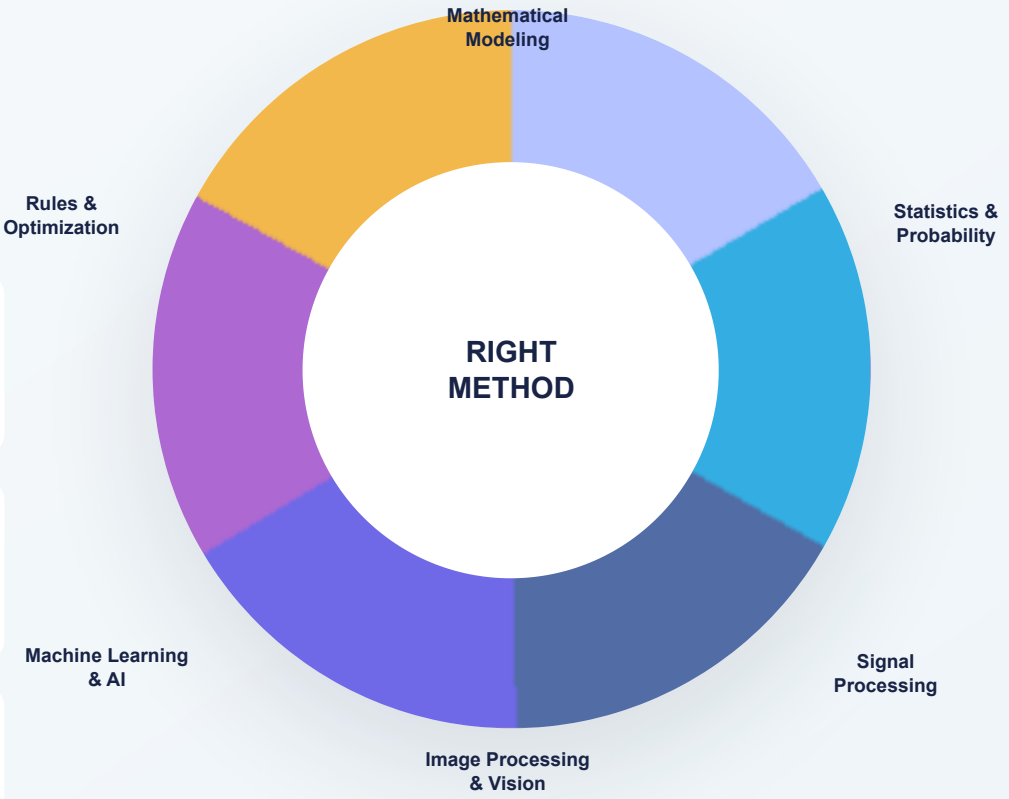
Mathematics, rules, statistics, signal or image processing, optimization, ML, or AI—selected by the actual need.

Engineered for deployment

Interfaces, data pipelines, validation, performance, edge cases, and maintainability are part of the build.

Integrated and supported

Outputs are delivered through applications, alerts, workflows, and services that people can use and operate.



Experience across the complete build-and-deliver cycle

Across different projects, we have formed the disciplines needed to solve the full problem—not only one technical layer. Our role has extended from physical design and data acquisition to platforms, analytical engines, integration, and deployment.

Field & Equipment Connectivity

PLCs, controllers, sensors, devices, industrial communications, and IT/OT interfaces

Custom Physical Systems

Mechanical assemblies, fixtures, enclosures, test setups, and purpose-built mechanisms

Electronics & Data Acquisition

Custom hardware, embedded units, signal conditioning, gateways, and edge collection

Platforms & Big Data

Applications, APIs, data pipelines, scalable storage, services, and operational dashboards

Applied Analytics

Vision, image and signal processing, mathematical models, probability, optimization, and AI

Operationalization

System integration, validation, deployment, documentation, monitoring, and lifecycle support

DEFINE	BUILD	INTEGRATE	DELIVER
Translate the operational need into scope, architecture, and acceptance criteria.	Engineer the hardware, software, data, and analytical components required.	Connect with existing systems, users, workflows, and operating conditions.	Validate, deploy, document, support, and prepare the solution to scale.

Bring the operational challenge. We will build the delivery path.

01
Align
Define the operational outcome, constraints, available systems, users, and acceptance criteria.

02
Engineer
Design the physical, electronic, software, data, and analytical workstreams as one solution.

03
Demonstrate
Build a working implementation that proves integration, usability, and technical value.

04
Deploy & Scale
Harden, document, integrate, roll out, support, and extend the delivered system.

A hands-on multidisciplinary delivery partner for turning complex operations into working digital systems.
